SUMMARY

The discussion focuses on two tracking devices: the Tabs Object Locator and the GeoBit Smart Tag, designed to help locate children or belongings through smartphone apps. While these devices offer safety benefits, concerns arise regarding their effectiveness, battery life, and practicality for busy parents.

- Tabs Object Locator and GeoBit Smart Tag are tracking devices for locating children or objects.*
- They connect to smartphone apps, providing real-time location tracking.*
- The devices alert users when the tracked individual is within 100 meters, but this distance may be too far for immediate safety.*
- Battery life lasts about a week, which may be inconvenient for busy parents to manage.*
- Concerns include the potential for kids to lose or ditch the devices in crowded places.*
- Suggestions for improvement include making devices smaller and less detectable, possibly integrating them into everyday items like shoes.*
- The speaker invites audience feedback on their experiences with tracking devices.*

today I'm gonna be talking to you all about new technology to help you track down your devices or children or significant others if you know what I mean I'm talking about two different tracking technology devices that are out on the market right now the first one is tabs object locator and the other one is the geo bit smart tag so the object of these things are to attach them to an object or person so you can try to find

them if you are separated from them they all work with like apps on your phone now I do think these are pretty cool for kids because your kids always wandering off or the going places you can't find them they're just for safety purposes you'll at least be able to locate your children let's do a little test let's find out if this thing works so we've hooked it up to this iPhone and you can see there's where I am the F as in

father and the little unicorn as in the kid we're gonna hand this to our trusty assistant she's gonna walk off and we're gonna see as she walked out of the room how much he'd be see it already grew a little further right there it's growing father and father's so she's going away but at this point I can't even see her anymore I need to know I needed to alert me that she has left once she gets

within I believe 100 meters of me I'm able to know that she's gone and it will send me alert they'll start vibrating and say she's gone she's gone we're separated but a hundred meters it's already too far away that's one of the things I have I feel like I just need more immediate response now the main thing that would concern me about these devices is the battery life okay so this is supposed to keep my kids safe and

keep track of them or what have you but it lasts a week which sounds great but as a busy parent like to remember to charge this thing after a week it's not gonna happen so the longer these batteries will last the better and usually when kids get lost it's either at the store at the mall or at like a big event like a fair or the amusement park or something like that where there's tons of people or who

knows after even wearing it anymore would have it got ditched inside the road and they don't even have it on anymore you still don't know where they are I think if they made them smaller less detectable and like and if they would go in the sole of your shoe so you know how I feel about these things what are you all thank please let us know by commenting in the comment section below would you use them have

you used them what's your experience been like let us know [Music] [Music]
